### PONY CLAMP

The Ritherdon quick release pony clamp has been designed as a simple and reliable way to mount an independent air source on the side of the main air cylinder.

Cylinders for illustration purposes only

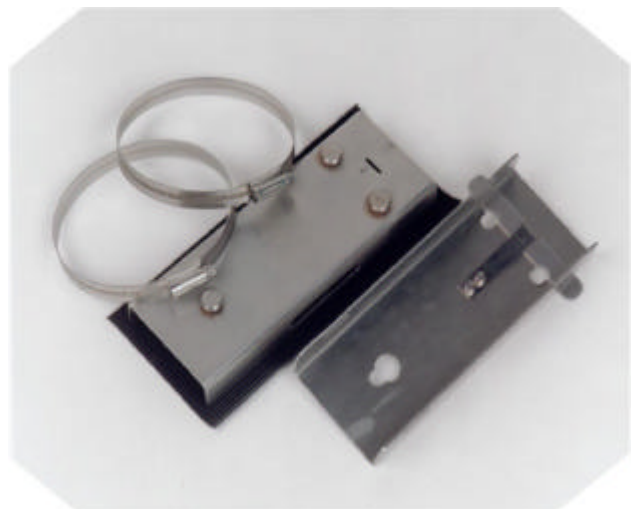

Under normal circumstances, one half of the bracket would be secured to the main cylinder using the cam band. Once the aqualung set has been assembled, the pony cylinder can be quickly attached using the quick release mechanism.

Following a dive, the pony cylinder can be quickly removed allowing easy transportation for filling or for ease of changing over the main cylinder for use on a repeat dive.

The Ritherdon quick release pony clamp is manufactured from high quality stainless steel. The robust design and construction should give a long and reliable service life.

We also welcome enquiries for other specialised metalwork.

## TWINNING BANDS

The Ritherdon stainless steel twinning bands are used to join two cylinders together to form a twin set. The bands come in three sizes to suit cylinders that are 5 ½", 7" and 8" diameter (140mm, 180mm and 205mm diameter). Other sizes or modified versions can be supplied on request. The twinning bands are made from high quality stainless steel sheet, and the fittings from A4 stainless steel.

## ACCESSORY BUCKLE

The Ritherdon accessory buckle is manufactured from high quality stainless steel sheet. It can be attached to the cylinder cam band or your weight belt to provide a fixed point for clipping accessories such as a torch. The design allows accessories to be attached single handed, which is not always possible when using D rings.
